Date.....

The Hanging Gardens of Badylon, the great pyramids of Egypt and movemental structur's built during the Roman Empire are the result of man's quest to explore Building methods and materials. But inspite of advanced technology in building materials and construction architect's face many technical problem. Salt peter action is one of the most common frequent problem. Its damaging effects may be seen on walls of various buildings. Salt peter action not only damages the paint but it damages plaster also. This in caused by excessive percentage of potassium nitrate either in the soil where the construction is done or in the soil from which bricks are made.

Till now there was no satisfactory solution available in the market but recently a new compound developed by Mr. Oberoi is the one much awaited as it neutralige the effect of harmful salt thus providing a permanent solution.
